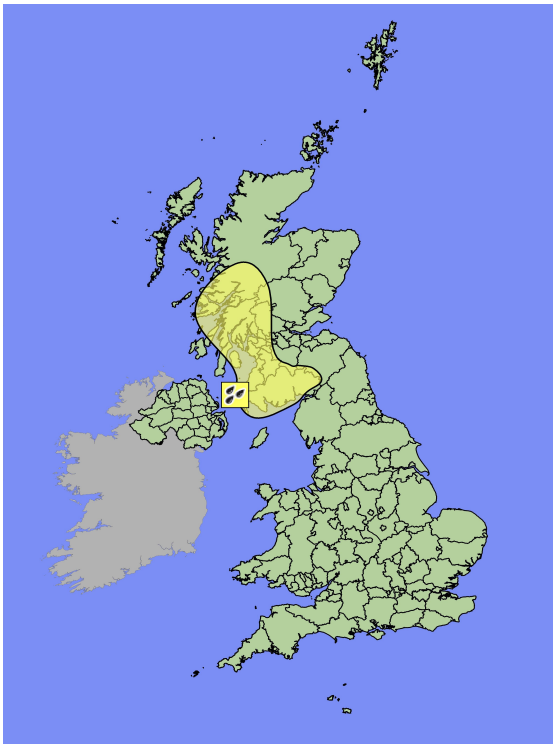
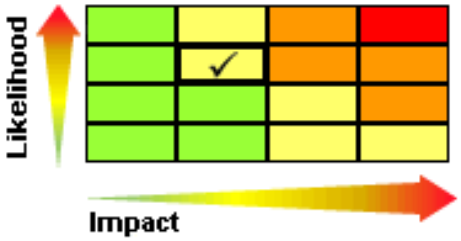
National Severe Weather Warning Service





Chief Forecasters Assessment
The cold front is likely to be slow-moving over Scotland on Wednesday, with small scale waves running along it complicating the rainfall distribution and making its exact position increasingly uncertain. It is possible that the front may sink southwards to affect Dumfries and Galloway though the day bringing the heavy rain southwards into these parts before weakening on Wednesday night. An additional 15-25 mm of rain is likely with isolated totals of 40-50 mm possible in hilly areas.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **00:05 on Wed, 14th Nov 2012** until **23:59 on Wed, 14th Nov 2012**

Persistent rain will continue to affect parts of Western Scotland on Wednesday. The heaviest rain seems likely to affect Argyll and Lochaber in the morning, but may spread south to affect the rest of Strathclyde and Dumfries and Galloway during the day. Falling on already saturated ground, the public should be aware that this rain could lead to some localised disruption and the possibility of flooding.
The rain is expected to ease on Wednesday night.
